Allergy/JNC: Cancer association with breast implants has ‘very little’ impact on plastic surgeon community; recalls highly unlikely by Kenneth A. Hart for the New York Times

This article is posted in PT to reach the New York Times. It is a very important and timely piece that discusses the most profitable surgeons in the world, their Global Financial Marketizes. See, theostrasbridge.com

Allergy/JNC: The American Academy of Allergy and Asthma estimates that breast implant-associated anaphylaxis is “rare” and occurs in less than 1% of patients. However, the JNC panel notes that there is a “limited data” on the long-term effects of breast implants. While the JNC panel does not recommend breast augmentation, the discussion remains a point of concern because patients may continue to receive medical advice, including ALLERGIES.

The JNC panel also notes that the use of breast implants is a “very rare” event, and that patients should be advised to consult with their surgeon and the JNC panel before deciding to undergo breast augmentation. The panel also recommends that patients be referred to breast surgeons for evaluation and treatment.

In summary, the JNC panel is concerned about the potential impact of breast implants on patient outcomes and the need for further research to better understand the long-term effects of breast augmentation. Patients and surgeons are encouraged to consult with the JNC panel and other experts before making decisions about breast augmentation.
